Frontoclypeus slightly raised, impunctate; antenna slightly shorter than the body, second segment very small, third shorter than twice as long as second, fourth distinctly longer than third, fifth to eighth about equal in length. Pronotum about 1.7 times as broad as long, disc almost impunctate, foveolate on each side of middle. Elytra obviously wider than pronotum at base, humeral callus strongly raised, with a distinct humeral costa and a parasuture costa, very finely and indistinctly punctate.
